

## Supplemental Material

### Population Abundance and Ecosystem Service Provision: the Case of Birds

KEVIN J. GASTON, DANIEL T.C. COX, SONIA B. CANAVELLI, DANIEL GARCÍA, BAZ HUGHES,  
BEA MAAS, DANIEL MARTÍNEZ, DARCY OGADA, AND RICHARD INGER

### Contents

**Appendix S1.** Statistical analysis.

**Table S1.** Statistical results and model selection data.

**Figure S1.** Further case studies of relationships between bird abundance and ecosystem service provision. See Table 1 for details.

## **Appendix S1. Statistical Analysis**

### **Cultural Services - Visitors to nature reserves.**

Total bird abundances were calculated from the UK's Wetland Bird Survey (WeBS) and Visitor numbers were provided by the WWT for the 10 years between 2005 and 2014. As most of the birds using the nature reserves are winter migrants we only considered data from October to March (whilst the dataset was mostly complete, there were a few months missing for some centres). As visitor numbers are affected by the weather (B. Hughes, pers. comm.) we included weather data obtain from the nearest Met Office historical station to each of the Wetland Centre's into the models. Weather data included were mean daily maximum temperature, mean daily minimum temperature, number of air frost days, total rainfall and total sunshine duration.

For all Wetland Centre's, visitor numbers (logarithmically transformed) were modelled using general linear mixed effect models with bird abundance and the weather variables as predictors and Wetland Centre location as a random factor. Linear, logarithmic and polynomial models were fitted and the best fit selected based on  $R^2$  using the methods of Nakagawa and Schielzeth (2013). Predictors were standardized using the 'arm' package and model simplification was achieved by comparing all subsets of the global model using AIC and retaining all models within  $dAIC < 6$  of the top model. Where multiple models were retained model averaging was used to produce final parameter estimates and the relative importance of each model (Table S1e).

As the various Wetland Centre's are all quite different, visitor numbers were also modelled separately for each Centre using general linear models. Model selection and simplification were carried out as for the 'All Centre's' model (Table S1e).

### **Other Services**

Linear, logarithmic, 2nd order polynomial, asymptotic models were produced for all data sets. Asymptotic models were based on the Michaelis-Menten equation and modelled using the self-starting 'nls' model in the 'stats' package. The best model for selection based on model fit using the coefficient of determination ( $R^2$ ) and model parsimony using AIC. In all cases the best model had the highest  $R^2$  and lowest AIC.

Asymptotic model from Jackson et al. 2008. All calculations and analyses were carried out in the R language and environment for statistical computing (v3.3.0).

1 **Table S1:** Statistical results and model selection data for; a) Nutrient transport, b) Seed dispersal, c) Scavenging, d) Pest control, e) Cultural: bird  
 2 count and visitor numbers, f) Mental health, g) Dis-service: crop damage. B1 = first parameter. Vm = Maximum rate (Michaelis-Menten equation).  
 3 B1CI low = lower confidence interval for the first parameter. B1CI high = higher confidence interval for the first parameter. B2 = second parameter  
 4 (polynomial models). K= point at which abundance is half of the asymptote. B2 CI low = lower confidence interval for the second parameter. B2 CI  
 5 high = lower confidence interval for the second parameter.

23

24 e) Cultural: bird count and visitor numbers

25 Model fitting results to establish the relationship between bird abundance and visitors number to WWT Wetland Centre's whilst considering weather

26 variables. All centres models are general linear mixed effect models, with centre as a random variable. Other models are linear models. Most

27 parsimonious model is highlighted in bold. Parameter estimates and statistics refer to the most parsimonious model.

28

42

43 **Figure S1.** Further case studies of relationships between bird abundance and ecosystem service  
 44 provision. From left to right, the top row shows supporting services (nutrient transport for penguins;  
 45 seed dispersal 2 and 3); mid row shows regulating services (pest control); bottom row shows  
 46 cultural services (all reserves (no relationship found), lower levels of depression). See Tables 1  
 47 and S1 for details.
