Outlook

- Motivation
- Deformed SO(8)-gauged supergravity
- Deformed ISO(7)-gauged supergravity
- Massive type IIA strings on S^6
- New AdS_4 N=2 solution in massive IIA and its CFT_3 dual

Motivation

electric-magnetic deformations

- The uniqueness of the maximal (N=8) supergravities is historically inherited from their connection to sphere reductions

$AdS_5 \times S^5$ (D3-brane) , $AdS_4 \times S^7$ (M2-brane) , $AdS_7 \times S^4$ (M5-brane)

- N=8 supergravity in 4D admits a deformation parameter c yielding inequivalent theories. It is an electric/magnetic deformation

$$D = \partial - g\,(A^{\text{elec}} - c\,\tilde{A}_{\text{mag}})$$

g = 4D gauge coupling
c = deformation param.

- There are two generic situations :

1) Family of $SO(8)_c$ theories : $c = [0, \sqrt{2} - 1]$ is a continuous param. [similar for $SO(p,q)_c$]

2) Family of $ISO(7)_c$ theories : $c = 0$ *or* 1 is an (on/off) param. [same for $ISO(p,q)_c$]

[Dall'Agata, Inverso, Trigiante '12]
[Dall'Agata, Inverso, Marrani '14]

The questions arise:

- Does such an electric/magnetic deformation of 4D maximal supergravity enjoy a string/M-theory origin, or is it just a 4D feature ?

Obstruction for $SO(8)_c$, *cf*. [Lee, Strickland-Constable& Waldram '15]

[de Wit & Nicolai '13]

- For deformed 4D supergravities with supersymmetric AdS_4 vacua, are these AdS_4/CFT_3-dual to any identifiable 3d CFT ?

Ungauged (abelian) supergravity: Reduction of M-theory on a *torus* T^7 down to 4D produces $N = 8$ supergravity with $G = U(1)^{28}$ [Cremmer & Julia '79]

Gauged (non-abelian) supergravity: Reduction of M-theory on a *sphere* S^7 down to 4D produces $N = 8$ supergravity with $G = SO(8)$ [de Wit & Nicolai '82]

… but … is this true?

Framework to study $N = 8$ supergravities in 4D

[de Wit, Samtleben & Trigiante '03 , '07]

Gauging procedure : Part of the global E_7 symmetry group is promoted to a local symmetry group G (gauging)

$[\,\alpha = 1, \ldots, 133\,]$

Embedding tensor : It is a "selector" specifying which generators of E_7 (there are 133!!) become the gauge symmetry G and, therefore, have associated gauge fields.

Formulation in terms of 56 vectors A_μ^M , though… $M = 1 , \ldots , 56 = 28$ (elec) + 28 (mag)

Deformed ISO(7)-gauged supergravity

A family of G = ISO(7) supergravities in 4D

- Choose G = ISO(7)

- Solve $\Omega^{MN}\,\Theta_M{}^{\alpha}\,\Theta_N{}^{\beta} = 0$ ⇒ One-parameter (c) family of $\mathrm{ISO}(7)_c$ theories !!

[Dall'Agata, Inverso, Marrani '14]

- Immediate questions :

1) What? (Yes, and still surprising)

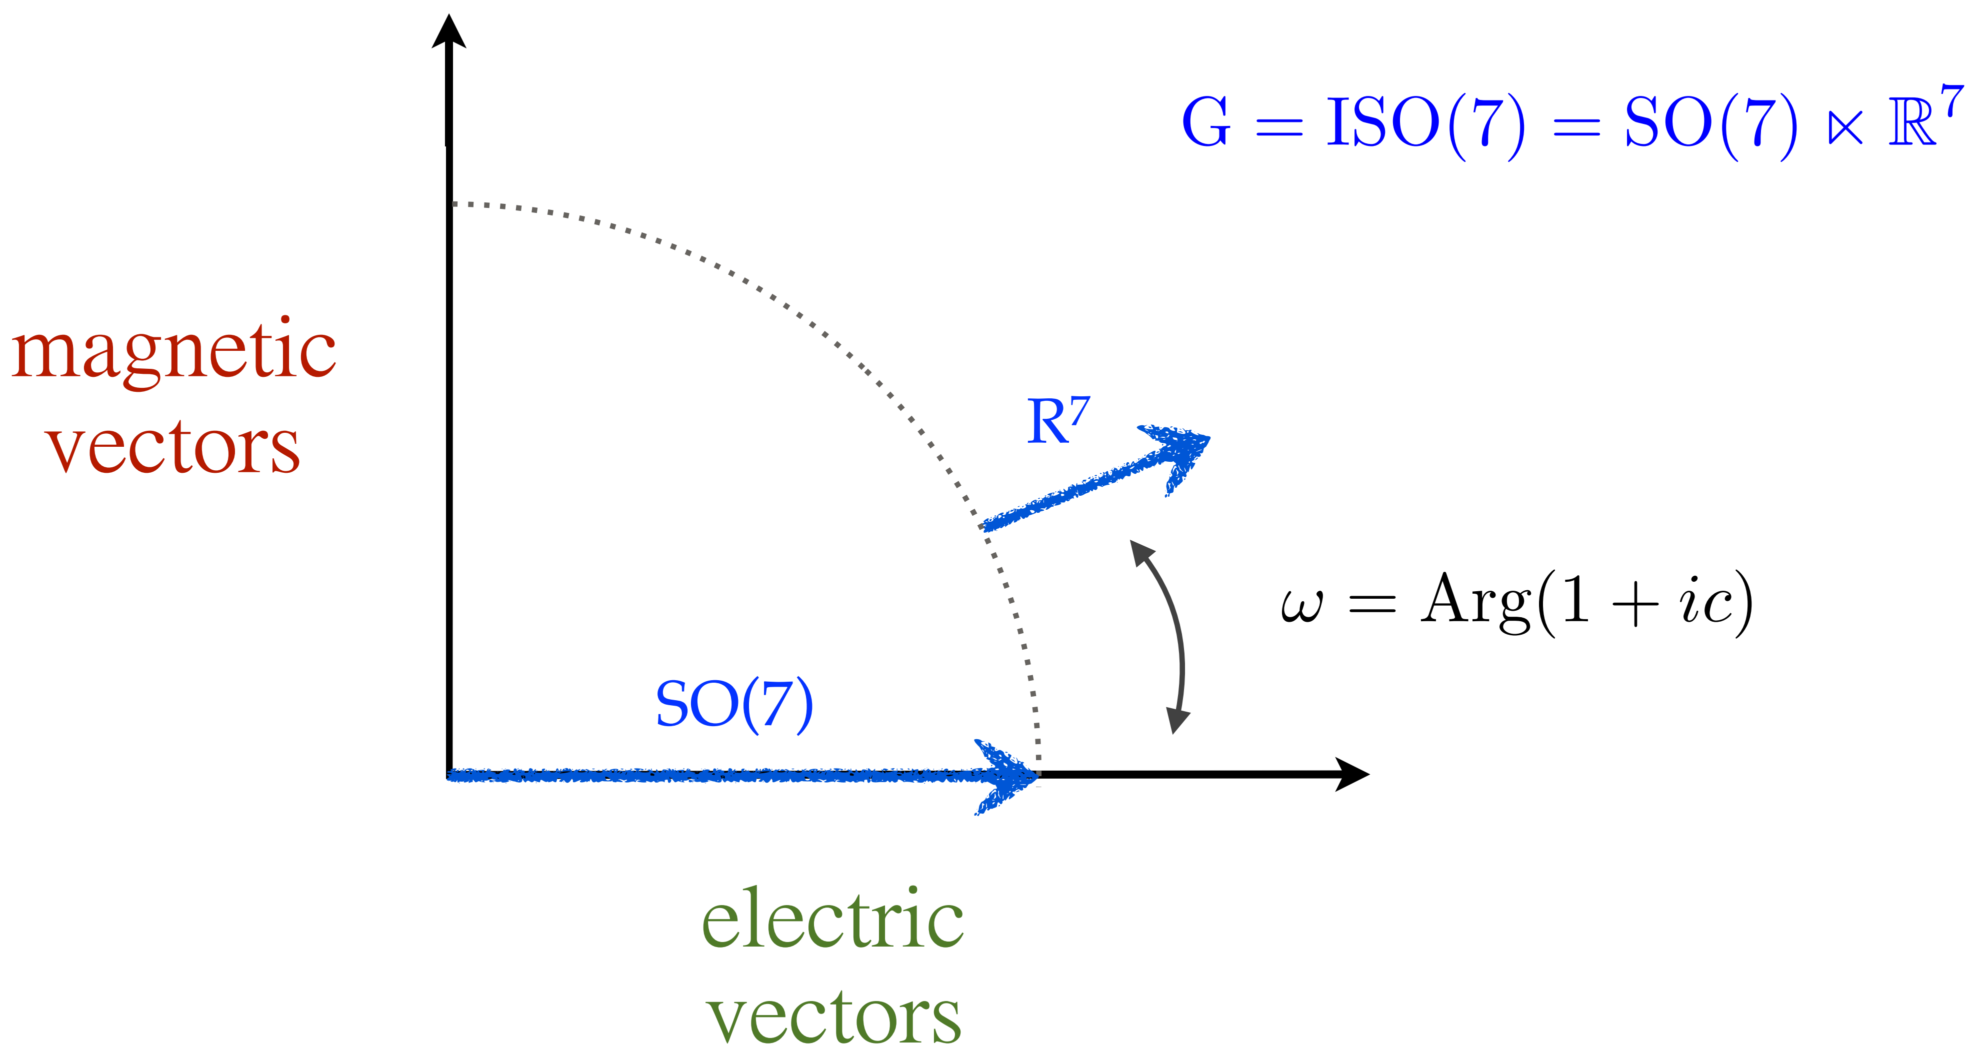
2) Are these c-theories equivalent? (No)

3) Are there new AdS_4 solutions? (Yes)

4) Higher-dimensional origin? (Yes)

5) AdS_4/CFT_3 dual? (Yes)

Physical meaning in 4D = electric / magnetic deformation



$$D = \partial - g\, A^{\mathrm{elec}}_{\mathrm{SO}(7)} - g\,(A^{\mathrm{elec}}_{\mathbb{R}^7} - c\, \tilde{A}_{\mathbb{R}^7\, \mathrm{mag}})$$

Deformed ISO(7)$_c$ Lagrangian $(m = gc)$

$\mathbb{M} = 1, \dots, 56$
$\Lambda = 1, \dots, 28$
$I = 1, \dots, 7$

$$\mathcal{L}_{\text{bos}} = (R - V)\,\text{vol}_4 - \tfrac{1}{48} D\mathcal{M}_{\mathbb{MN}} \wedge * D\mathcal{M}^{\mathbb{MN}} + \tfrac{1}{2}\,\mathcal{I}_{\Lambda\Sigma}\,\mathcal{H}^{\Lambda}_{(2)} \wedge *\mathcal{H}^{\Sigma}_{(2)} - \tfrac{1}{2}\,\mathcal{R}_{\Lambda\Sigma}\,\mathcal{H}^{\Lambda}_{(2)} \wedge \mathcal{H}^{\Sigma}_{(2)}$$
$$+\; m \left[\mathcal{B}^I \wedge \left(\tilde{\mathcal{H}}_{(2)I} - \tfrac{g}{2}\delta_{IJ}\mathcal{B}^J\right) - \tfrac{1}{4}\,\tilde{\mathcal{A}}_I \wedge \tilde{\mathcal{A}}_J \wedge \left(d\mathcal{A}^{IJ} + \tfrac{g}{2}\,\delta_{KL}\,\mathcal{A}^{IK} \wedge \mathcal{A}^{JL}\right)\right]$$

✦ Setting $m = 0$, all the magnetic pieces in the Lagrangian disappear.

✱ *Ingredients :*

- Electric vectors $(21+7)$: $\mathcal{A}^{IJ} = \mathcal{A}^{[IJ]}$ [SO(7)] and $\mathcal{A}^{I}$ [$\mathbb{R}^7$] with $\mathcal{H}^{\Lambda}_{(2)} = (\,\mathcal{H}^{IJ}_{(2)}\,,\,\mathcal{H}^{I}_{(2)}\,)$
- Auxiliary magnetic vectors (7) : $\tilde{\mathcal{A}}_I$ [$\mathbb{R}^7$] with $\tilde{\mathcal{H}}_{(2)I}$ field strength
- $E_7/SU(8)$ scalars : $\mathcal{M}_{\mathbb{MN}}$
- Auxiliary two-forms (7) : $\mathcal{B}^I$ [$\mathbb{R}^7$]
- Topological term : m […]
- Scalar potential : $V(\mathcal{M}) = \dfrac{g^2}{672} X_{\mathbb{MN}}{}^{\mathbb{R}} X_{\mathbb{PQ}}{}^{\mathbb{S}} \mathcal{M}^{\mathbb{MP}} \left(\mathcal{M}^{\mathbb{NQ}}\mathcal{M}_{\mathbb{RS}} + 7\,\delta^{\mathbb{Q}}_{\mathbb{R}}\,\delta^{\mathbb{N}}_{\mathbb{S}}\right)$

A truncation : $G_0 = SU(3)$ invariant sector

[Warner '83]

- Truncation : Retaining the fields and couplings which are invariant (singlets) under the action of a subgroup $G_0 \subset \text{ISO}(7)$

  - SU(8) R-symmetry branching : gravitini $\mathbf{8} \to \mathbf{1} + \mathbf{1} + \mathbf{3} + \bar{\mathbf{3}}$ ➡ $\mathcal{N} = 2$ SUSY
  - Scalars fields : $\mathbf{70} \to \mathbf{1}\ (\times 6) + \text{non-singlets}$ ➡ 6 real scalars $(\varphi\,,\, \chi\,;\, \phi\,,\, a\,,\, \zeta\,,\, \tilde{\zeta}\,)$
  - Vector fields : $\mathbf{56} \to \mathbf{1}\ (\times 4) + \text{non-singlets}$ ➡ vectors $(\,A^0, A^1\,;\, \tilde{A}_0, \tilde{A}_1\,)$

- $N = 2$ gauged supergravity with $G = U(1) \times SO(1,1)_c$ coupled to 1 vector & 1 hyper

$$\mathcal{M}_{\text{scalar}} = \frac{\text{SU}(1,1)}{\text{U}(1)} \times \frac{\text{SU}(2,1)}{\text{U}(2)}$$

- Scalar potential :

$$\begin{aligned} V \;=\;& \tfrac{1}{2}\, g^2 \Big[e^{4\phi-3\varphi}(1+e^{2\varphi}\chi^2)^3 - 12\, e^{2\phi-\varphi}(1+e^{2\varphi}\chi^2) - 12\, e^{2\phi+\varphi}\rho^2(1-3\, e^{2\varphi}\chi^2) \\ &- 24\, e^{\varphi} + 12\, e^{4\phi+\varphi}\, \chi^2\, \rho^2\, (1+e^{2\varphi}\chi^2) + 12\, e^{4\phi+\varphi} \rho^4\, (1+3\, e^{2\varphi}\chi^2) \Big] \\ &- \tfrac{1}{2}\, g m\, \chi\, e^{4\phi+3\varphi}\, (12\, \rho^2 + 2\chi^2) + \tfrac{1}{2}\, m^2\, e^{4\phi+3\varphi} \;, \end{aligned}$$

The truncated Lagrangian and its dual formulation

- The Lagrangian contains a non-dynamical tensor field B^0 :

$$\begin{aligned}\mathcal{L} &= (R-V)\,\mathrm{vol}_4 + \tfrac{3}{2}\left[d\varphi\wedge *d\varphi + e^{2\varphi}\,d\chi\wedge *d\chi\right]\\ &+ 2\,d\phi\wedge *d\phi + \tfrac{1}{2}\,e^{2\phi}\,[D\zeta\wedge *D\zeta + D\tilde{\zeta}\wedge *D\tilde{\zeta}]\\ &+ \tfrac{1}{2}\,e^{4\phi}\,[Da+\tfrac{1}{2}(\zeta D\tilde{\zeta}-\tilde{\zeta}D\zeta)]\wedge *[Da+\tfrac{1}{2}(\zeta D\tilde{\zeta}-\tilde{\zeta}D\zeta)]\\ &+ \tfrac{1}{2}\,\mathcal{I}_{\Lambda\Sigma}\,H^{\Lambda}_{(2)}\wedge *H^{\Sigma}_{(2)} - \tfrac{1}{2}\,\mathcal{R}_{\Lambda\Sigma}\,H^{\Lambda}_{(2)}\wedge H^{\Sigma}_{(2)} + m\,B^0\wedge d\tilde{A}_0 + \tfrac{1}{2}\,g\,m\,B^0\wedge B^0\end{aligned}$$

- Solving the EOM for the magnetic vector, one finds

$$H^0_{(3)} = e^{4\phi} * \left(Da + \tfrac{1}{2}\,(\zeta\,D\tilde{\zeta} - \tilde{\zeta}\,D\zeta)\right)$$

⇒ scalar-tensor duality!!

- The dual Lagrangian contains a dynamical tensor field $H^0 = dB^0$:

$$\begin{aligned}\widetilde{\mathcal{L}} &= (R-V)\,\mathrm{vol}_4 + \tfrac{1}{2}\,e^{-4\phi}\,H^0_{(3)}\wedge *H^0_{(3)} + \tfrac{3}{2}\left[d\varphi\wedge *d\varphi + e^{2\varphi}\,d\chi\wedge *d\chi\right]\\ &+ 2\,d\phi\wedge *d\phi + \tfrac{1}{2}\,e^{2\phi}\left[D\zeta\wedge *D\zeta + D\tilde{\zeta}\wedge *D\tilde{\zeta}\right]\\ &+ \tfrac{1}{2}\,\mathcal{I}_{\Lambda\Sigma}\,H^{\Lambda}_{(2)}\wedge *H^{\Sigma}_{(2)} - \tfrac{1}{2}\,\mathcal{R}_{\Lambda\Sigma}\,H^{\Lambda}_{(2)}\wedge H^{\Sigma}_{(2)}\\ &- H^0_{(3)}\wedge\left[g\,A^0 + \tfrac{1}{2}\,(\zeta D\tilde{\zeta}-\tilde{\zeta}D\zeta)\right] + \tfrac{1}{2}\,gm\,B^0\wedge B^0\ .\end{aligned}$$

Q : Why to bother with all these tensor hierarchy issues?

A : Because the tensor hierarchy allows us to derive simple formulas to embed the 4D *dynamics* into a higher-dimensional theory

Remember : *No index, no clue*. Good luck trying to embed V into higher dimensions…

Massive type IIA strings on S^6

Collecting clues

• The deformed ISO(7)$_c$ gauging has its SO(7) piece untouched by the deformation. This points towards an undeformed S^6 description in higher dimension.

• If the higher-dimensional geometry is not affected, it should then be the higher-dimensional theory the one changing. The massive IIA theory by Romans proves a natural candidate. [Romans '86]

• The Romans mass parameter $\hat{F}_{(0)}$ is a discrete (on/off) deformation, exactly as the parameter c in the deformed ISO(7)$_c$ theory.

• The SU(3)-invariant sector of the ISO(7)$_c$ theory connects to CY_3 reductions of massive IIA upon dualisation of some field. It is then natural to believe that the embedding of the full ISO(7)$_c$ theory would require an enlarged set of duality relations… tensor hierarchy!!

Derivation of the IIA embedding [4-step process]

* Step 1 : 10D KK decomposition that leaves 4D spacetime symmetry manifest

  $A(x,y)$'s and $B(x,y)$'s fields

* Step 2 : Redefinitions of the A's and B's fields to conform 4D SUSY transformations

  $C(x,y)$'s fields

* Step 3 : Connection to actual 4D fields by dressing up with S^6 geometrical data

$$C(x,y) = \text{geometry}(y) \times \mathcal{C}(x)$$

* Step 4 : Plug and play

[Following prescription by de Wit & Nicolai '86, Godazgar, Godazgar & Nicolai '13, …]

∗ Step 1 : 10D redefinitions (KK decomp) that leave 4D spacetime symmetry manifest

$$\mathrm{SO}(1,9) \to \mathrm{SO}(1,3) \times \mathrm{SO}(6)$$

Then one has :

$$\begin{aligned}
d\hat{s}^2_{10} &= \Delta^{-1}\, ds^2_4 + g_{mn}\big(dy^m + B^m\big)\big(dy^n + B^n\big) \ , \\

&\quad + \tfrac{1}{2} A_{\mu m n}\, dx^\mu \wedge \big(dy^m + B^m\big) \wedge \big(dy^n + B^n\big) \\
&\quad + \tfrac{1}{6} A_{mnp}\big(dy^m + B^m\big) \wedge \big(dy^n + B^n\big) \wedge \big(dy^p + B^p\big) \ , \\

Remarks and consistency checks

- 10D (bosonic) SUSY transformations exactly reduce to those of the 4D tensor hierarchy.

- Computing the 10D field strengths $\hat{F}_{(2)} = d\hat{A}_{(1)} + m\,\hat{B}_{(2)}$, etc. one finds

$$\hat{F}_{(4)} = \mu_I \mu_J\, \mathcal{H}^{IJ}_{(4)} + g^{-1}\, \mathcal{H}_{(3)\,J}{}^{I} \wedge \mu_I D\mu^J + \tfrac{1}{2}\, g^{-2}\, \tilde{\mathcal{H}}_{(2)IJ} \wedge D\mu^I \wedge D\mu^J + \dots \,, \qquad \text{[FR parameter]}$$

$$\hat{H}_{(3)} = -\mu_I\, \mathcal{H}^I_{(3)} - g^{-1}\, \tilde{\mathcal{H}}_{(2)I} \wedge D\mu^I + \dots \,,$$

$$\hat{F}_{(2)} = -\mu_I \mathcal{H}^I_{(2)} + g^{-1} \left(g\, \delta_{IJ}\, \mathcal{A}^J - m\, \tilde{\mathcal{A}}_I \right) \wedge D\mu^I + \dots \,,$$

which are expressed in terms of the 4D tensor hierarchy. The parameter $m{=}gc$ only appears through standard Romans' redefinitions of $\hat{F}_{(p)}$ in 10D (formulas also valid for massless IIA)

[Hull & Warner '88 (electric)]

- The set of Bianchi identities of the above 10D field strengths reduces to

$$D\mathcal{H}^{IJ}_{(2)} = 0 \;,\;\; D\mathcal{H}^{I}_{(2)} = m\, \mathcal{H}^I_{(3)} \;,\;\; D\tilde{\mathcal{H}}_{(2)IJ} = -2\, g\, \mathcal{H}_{(3)[I}{}^{K}\, \delta_{J]K} \;,\;\; D\tilde{\mathcal{H}}_{(2)I} = g\, \delta_{IJ}\, \mathcal{H}^J_{(3)} \;,$$

$$D\mathcal{H}_{(3)I}{}^{J} = \mathcal{H}^{JK}_{(2)} \wedge \tilde{\mathcal{H}}_{(2)IK} + \mathcal{H}^J_{(2)} \wedge \tilde{\mathcal{H}}_{(2)I} - 2g\, \delta_{IK}\, \mathcal{H}^{JK}_{(4)} - \tfrac{1}{7}\, \delta^J_I\, (\text{trace}) \;,$$

$$D\mathcal{H}^I_{(3)} = -\mathcal{H}^{IJ}_{(2)} \wedge \tilde{\mathcal{H}}_{(2)J} \;, \qquad D\mathcal{H}^{IJ}_{(4)} \equiv 0 \;.$$

which exactly matches the one of the 4D tensor hierarchy.

N=2 solution of massive type IIA

[Luest & Tsimpis '09]
[see also Petrini & Zaffaroni '09]

- Using the uplifting formulae, it is a straightforward exercise to obtain the 10D embedding of a 4D critical point. An example is the N=2&U(3) AdS_4 point of the $ISO(7)_c$ theory

$$d\hat{s}^2_{10} = L^2 \frac{(3+\cos 2\alpha)^{\frac{1}{2}}}{(5+\cos 2\alpha)^{-\frac{1}{8}}} \left[ds^2(\text{AdS}_4) + \frac{3}{2}\, d\alpha^2 + \frac{6\sin^2\alpha}{3+\cos 2\alpha}\, ds^2(\mathbb{CP}^2) + \frac{9\sin^2\alpha}{5+\cos 2\alpha}\, \boldsymbol{\eta}^2 \right] ,$$

$$e^{\hat{\phi}} = e^{\phi_0} \frac{(5+\cos 2\alpha)^{3/4}}{3+\cos 2\alpha} \quad , \qquad \hat{H}_{(3)} = 24\sqrt{2}\, L^2\, e^{\frac{1}{2}\phi_0} \frac{\sin^3\alpha}{(3+\cos 2\alpha)^2}\, \boldsymbol{J} \wedge d\alpha ,$$

$$L^{-1}\, e^{\frac{3}{4}\phi_0}\, \hat{F}_{(2)} = -4\sqrt{6}\, \frac{\sin^2\alpha\cos\alpha}{(3+\cos 2\alpha)(5+\cos 2\alpha)}\, \boldsymbol{J} - 3\sqrt{6}\, \frac{(3-\cos 2\alpha)}{(5+\cos 2\alpha)^2}\, \sin\alpha\; d\alpha \wedge \boldsymbol{\eta} ,$$

$$L^{-3}\, e^{\frac{1}{4}\phi_0}\, \hat{F}_{(4)} = 6\,\text{vol}_4 + 12\sqrt{3}\, \frac{7+3\cos 2\alpha}{(3+\cos 2\alpha)^2}\, \sin^4\alpha\; \text{vol}_{\mathbb{CP}^2} + 18\sqrt{3}\, \frac{(9+\cos 2\alpha)\sin^3\alpha\cos\alpha}{(3+\cos 2\alpha)(5+\cos 2\alpha)}\, \boldsymbol{J} \wedge d\alpha \wedge \boldsymbol{\eta} ,$$

where we have introduced the quantities $L^2 \equiv 2^{-\frac{5}{8}}\, 3^{-1}\, g^{-2}\, c^{\frac{1}{12}}$ and $e^{\phi_0} \equiv 2^{\frac{1}{4}}\, c^{-\frac{5}{6}}$

CFT_3 candidate and matching of free energies

[Schwarz '04]
[Gaiotto & Tomassiello '09]

- We propose and N=2 Chern-Simons-matter theory with simple gauge group SU(N), level k and only adjoint matter, as the CFT of the N=2 massive IIA solution.

- The 3d free energy F = -Log(Z), where Z is the partition function on the CFT on a Euclidean S^3 can be computed via localisation over supersymmetric configurations

[Pestun '07] [Jafferis '10]
[Jafferis, Klebanov, Pufu & Safdi '11]

$$Z = \int \prod_{i=1}^{N} \frac{d\lambda_i}{2\pi} \prod_{i<j=1}^{N} \left(2\sinh^2\left(\frac{\lambda_i - \lambda_j}{2}\right)\right) \times \prod_{i,j=1}^{N} \left(\exp\left(\ell\left(\frac{1}{3} + \frac{i}{2\pi}(\lambda_i - \lambda_j)\right)\right)\right)^3 e^{\frac{ik}{4\pi}\sum \lambda_i^2}$$

where λ_i are the Coulomb branch parameters. In the $N \gg k$ limit, the result is given by

$$F = \frac{3^{13/6}\pi}{40}\left(\frac{32}{27}\right)^{2/3} k^{1/3} N^{5/3}$$

- The gravitational free energy can be computed from the warp factor in the N=2 massive IIA solution. Using the charge quantisation condition $N = -(2\pi\ell_s)^{-5}\int_{S^6} e^{\frac{1}{2}\phi} \hat{*}\hat{F}_{(4)} + \hat{B}_{(2)} \wedge d\hat{A}_{(3)} + \frac{1}{6}\hat{F}_{(0)}\hat{B}_{(2)}^3$ for the D2-brane, one finds

$$F = \frac{16\pi^3}{(2\pi\ell_s)^8}\int_{S^6} e^{8A}\,\mathrm{vol}_6 = \frac{\pi}{5} 2^{1/3} 3^{1/6} k^{1/3} N^{5/3}$$

provided

$$g\,c = \hat{F}_{(0)} = k/(2\pi\ell_s)$$

[Emparan, Johnson & Myers '99]

Summary

1) We have introduced a new method to embed 4D theories into 10D. Using this method, we have connected the dyonic N=8 supergravity with $ISO(7)_c$ gauging to massive IIA reductions on S^6.

2) Any 4D configuration (AdS, DWs, BH) is embedded into 10D via the uplifting formulas. As an example, we found a new $AdS_4 \times S^6$ solution of massive IIA based on an N=2&U(3) AdS_4 vacuum.

3) We propose a CFT_3 dual for the N=2 $AdS_4 \times S^6$ solution of massive IIA based on the D2-brane field theory. In the massive IIA case, there is a CS-term and a superpotential that make the theory flowing to a conformal phase (IR). This translates into the appearance of supersymmetric AdS_4 vacua in the deformed $ISO(7)_c$ supergravity theory.

4) For the new N=2 massive IIA solution, the gravitational and FT free energies do match provided

$$g\,c \;=\; \hat{F}_{(0)} \;=\; k/(2\pi\ell_s)$$

5) Extension to other dimensions? EGG / EFT for massive IIA?

Scalar potential and three-form potentials

- How does the scalar potential potential V fit in the duality hierarchy ?

$$\Theta_{\mathbb{M}}{}^{\alpha}\,\mathcal{H}_{(4)\alpha}{}^{\mathbb{M}} = -2\,V\,\text{vol}_4$$

- In our deformed ISO(7)$_c$ theory, one has four-form field strengths

$$g\,\delta_{IJ}\,\mathcal{H}^{IJ}_{(4)} + m\,\tilde{\mathcal{H}}_{(4)} = -2\,V\,\text{vol}_4 \qquad [\ \mathbf{28'} + \mathbf{1} \text{ of SL(7)}\ ]$$

where we need the **SL(7)-*singlet*** four-form field strength $\tilde{\mathcal{H}}_{(4)}$ dual to the magnetic ET

- Consistency requires also the three-form field strength $\mathcal{H}_{(3)}$ rendering $\mathcal{H}_{(3)I}{}^{J}$ traceful

$$\begin{aligned}
\mathcal{H}_{(3)} &= \tfrac{1}{12}(t_8{}^8)_{\mathbb{M}}{}^{\mathbb{P}}\,\mathcal{M}_{\mathbb{NP}} * D\mathcal{M}^{\mathbb{MN}}\ , \\

Freund-Rubin term

[Freund & Rubin '80]

- By looking at the RR field strength $\hat{F}_{(4)} = \mathcal{H}^{IJ}_{(4)}\,\mu_I\,\mu_J + \ldots$, one immediately identifies the Freund-Rubin term

$$\mathcal{H}^{IJ}_{(4)}\,\mu_I\,\mu_J = -\tfrac{1}{3}\,g^{-1}\,V\,\mathrm{vol}_4 + \tfrac{1}{84}\,g^{-1}\left(D\mathcal{H}_{(3)} - 7\,\mathcal{H}^{IJ}_{(2)} \wedge \tilde{\mathcal{H}}_{(2)IJ} - 7\,\mathcal{H}^{I}_{(2)} \wedge \tilde{\mathcal{H}}_{(2)I}\right)$$
$$-\tfrac{1}{2}\,g^{-1}\left(D\mathcal{H}_{(3)I}{}^{J} - \mathcal{H}^{JK}_{(2)} \wedge \tilde{\mathcal{H}}_{(2)IK} - \mathcal{H}^{J}_{(2)} \wedge \tilde{\mathcal{H}}_{(2)I}\right)\mu^I\,\mu_J\ ,$$

NOTE: We have expressed the EOMs for the scalars as BI for the three-form field strengths of the tensor hierarchy.

- At a critical point of V one has $\hat{F}_{(4)} = -\dfrac{1}{3g} V\,\mathrm{vol}_4 + \ldots$, and the S^6 dependence drops out
